

Visual Encoding

This is a really interesting paper to work on. I was wondering how the group decided on position versus angle. I would love to know more about that. Also, I was unsure if I heard/understood but there is a comparison between the largest components of each graph. Maybe an example could be helpful to see. I assume there would be one in your paper. I think it was cool to consider cheating; my group had not considered this. I would also be curious about how this is influenced per different cultures that use these graphs differently.

I was wondering if ordering would matter for displaying the graphs or if particular colors influenced people's spatial perceptions. The process looks good and in general the plan looks like it has been well thought out. I think this is interesting because data visualization has become more complex over time and our ability to quickly understand it may have improved overtime.
